

Fraud Support Gamified Assessment

Platform Methodology, Scoring & Proctoring Guide

1. Executive Overview

The Fraud Support Gamified Assessment Platform is a specialized evaluation tool designed specifically to evaluate candidate readiness for fraud operations roles. Operating in digital environments, fraud support agents require a unique mix of high verbal precision, analytical research skills, and critical thinking/logical judgment. The platform evaluates candidates dynamically through gamified, interactive scenarios while silently logging security indicators to protect test integrity.

2. The 8 Assessment Zones & 3 Core Competencies

The assessment is divided into 8 distinct zones, structured to test core competencies across three primary functional areas:

COMPETENCY A: LANGUAGE & COMMUNICATION (ENGLISH)		
Zone 1: Grammar	60s	Multiple-choice testing of core grammar, subject-verb agreement, tense, and article rules.
Zone 2: Sentence Correction	60s	Free-form rewrites of incorrect/unprofessional client emails to ensure proper punctuation & tone.
Zone 3: Macro Editing	60s	Refinement of canned replies in-place, transforming robotic text into empathetic customer interactions.
Zone 4: Reading Comprehension	180s	Analysis of customer claims. Tests retention of critical numbers, transaction dates, and core complaints.
Zone 5: Case Closure Notes	60s	Selecting final ticket status and composing 1-2 sentence summaries for audit trail logging.
COMPETENCY B: ATTENTION TO DETAIL (RESEARCH)		
Zone 6: Attention (L1)	120s	Spotting immediate mismatches/omissions (e.g. invoice/transaction gap) on a single case dashboard.
Zone 7: Attention (L2)	120s	Cross-referencing multiple tabs (Profile, Notes, Ledger) to detect subtle names/accounts inconsistencies.
COMPETENCY C: CRITICAL THINKING & DECISION MAKING		
Zone 8: Critical Thinking	180s	Weighing risk vectors (OTP failure + IP location switch) to determine correct freezing and escalation path.

3. Grading Architecture & Buckets

The candidate's performance is graded and grouped automatically into the three competency buckets by our Google Apps Script (GAS) backend (Code.gs and AsyncGrading.gs) based on the question metadata. Here is how the system directs and evaluates answers:

Grading Source & Mechanics

- English (Language) Bucket: Grades are sourced from Zones 1 to 5. Multiple-choice questions are auto-graded upon submission by comparing selection indices. Free-form text fields (Sentence Correction and Macro Editing) are graded based on predefined correct patterns or queued for reviewer inspection.
- Attention (Research) Bucket: Sourced from Zones 6 and 7. The system evaluates whether candidates correctly identify omissions or mismatches in the dashboard and multi-tab interface questions.
- Critical Thinking Bucket: Sourced from Zone 8. Candidates choose response strategies for fraud incidents. Answers are graded according to correct risk escalation and mitigation frameworks.

The A2 Fair Grading Policy

Under the A2 policy, the denominator of any percentage score excludes ungraded items. If a question is flagged as "ungraded" (e.g. pending recruiter audit), it is removed from the total questions count. This ensures that unresolved manual grading questions do not penalize the candidate's overall status.

4. Advisory Recommendation Tiers

Following grading, candidates are automatically placed into one of three Recommendation Tiers. Note that these categories are strictly advisory; the platform never executes auto-rejections, leaving the final decision to the recruiting team.

Recommendation Tier	Min. Overall Score	Specific Competency Hurdles	Hiring Advisory Description
Strong Fit	>= 80%	>= 75% Critical Thinking AND >= 75% Research (Attention)	Excel under ambiguity. Proven analytical and language capabilities. Highly recommended.
Consider	>= 60%	None	Solid baseline skill sets. Likely needs minor coaching on complex fraud logic/edge-cases.
Not Recommended	< 60%	None	Candidate falls below the minimum proficiency. Substantial training required.

Recruiter Verdict Override

Recruiters have the ability to review any candidate response (such as manual free-text inputs) and override a graded verdict (e.g. converting a system-marked Incorrect to Correct). Changing any verdict triggers an immediate, real-time re-aggregation of all scores, narrative insights, and recommendation tiers.

5. Proctoring Capabilities

To ensure exam security, a comprehensive monitoring suite operates quietly in the background without interrupting the candidate during the assessment. Captured behaviors include:

1. Window Blur & Tab Switches

Tracks each instance where a candidate leaves the assessment tab (e.g. to search the web or open another application). Logs the exact timestamp and duration in seconds.

2. Copy / Cut / Paste Detection

Logs all attempts to copy content out of the test or paste external content (e.g. AI-generated answers) into writing prompts.

3. Developer Tools Check

Uses a window dimension heuristic (measuring window outer vs. inner width/height) to detect if a candidate opens developer consoles.

4. Fullscreen Enforcement

Examines browser fullscreen status. If the candidate exits fullscreen, the system records it silently.

5. Webcam Face Recognition

If enabled, TensorFlow.js BlazeFace model runs client-side every 3 seconds to verify if a face is missing or if multiple people are in front of the camera.

6. Integrity Violation Evaluation Matrix

Integrity violations are logged silently to prevent testing anxiety. Recruiters should review logs using the following risk guidelines:

Violation Type	Risk Level	Common Benign Causes	Red Flags / Actions
Tab Switch / Blur	Low	System notifications, clicking a volume slider.	Frequent switches (>10) or long blur durations (>60s).
Fullscreen Exit	Low	Accidental keypress, OS popups.	Exiting fullscreen combined with immediate copy-pastes.
Copy / Cut / Paste	Medium	Copying reference numbers from the text.	Pasting long text blocks into response text areas.
Dev Tools Resize	Medium	Resizing browser to adjust screen layout.	Recurrent resize events during critical thinking zones.
Webcam: No Face	Medium	Adjusting posture, picking up a pen.	Webcam blocked or face missing for >15 consecutive seconds.
Webcam: Multi-Face	High	Family member walking in background.	Active collaboration or secondary face looking at screen.

Strategic Recommendation for Leadership

Integrity warnings should be treated as risk indicators rather than auto-fail criteria. A candidate with a high violation score should be manually reviewed by evaluating their free-text notes, or scheduled for a brief follow-up interview to confirm competency. This ensures we do not disqualify excellent candidates due to minor system alerts.
